The Best In Classic Rock
Proto Rock
For Korg M3 Series

Thank you for your interest in Kid Nepro sounds.

Please note the two different folders that contain the PCG demo. The one you choose depends on which operating system your running on your M3. We recommend that you update to the M3 2.0 operating system if you have not done so. You can download the new OS at:

http://www.korg.com/service/downloadinfo.asp?DID=1432

This link will probably be updated at some point so if you get an error message then go to: http://www.korg.com/ and follow the links to the latest m3 operating system download page.

Included in the PCG file are eight programs from our M3 "Proto Rock" collection. They are designed for the Radias Expansion board so remember that you must have this board installed for everything to work. The sounds are set up to load into your USER-F Bank so if you have anything living in that bank save your data before loading in the demo.

Please contact us if you have any questions or comments. More info on our M3 sounds as well as our complete line of products can be found at:
